AMENDMENTS TO THE CLAIMS

The following is a complete, marked-up listing of revised claims with a status identifier in parenthesis, underlined text indicating insertions, and strike through and/or double-bracketed text indicating deletions.

LISTING OF CLAIMS

- 1. (Currently Amended) A system for controlling processes associated with streams of application data for a communication network including communication stations adapted configured to exchange data streams and connected to communication terminals provided with at least one application and one core containing information representative of said application[[s]], which system includes the system for controlling processes comprising:
 - i) processing means adapted, on receiving a first processor configured to

 receive a message designating an application, to and

 deliver service data representative of at least one process associated with
 said designated application[[,]];
 - ii) extraction means adapted, on receiving a second processor configured to,

 receive a stream of data sent by a communication terminal, to

 access the core of said terminal to determine the application associated
 with said received stream, and then to

deliver to said processing means first processor a message designating said determined application[[,]]; and

iii) control means adapted a controller configured to, on receiving

receive service data delivered by said processing means processor, to and

deliver configuration data adapted to enable at least one process suited to the requirements of the application associated with the received stream by the communication station to which the terminal from which said stream come is connected.

2. (Currently Amended) The system claimed in claim 1, wherein each

said communication terminal core includes an interface for real time control of the network data streams associated with said application.[[s]] and

said extraction means are adapted configured, on receiving a data stream, to access said control interface to determine the application associated with said received stream, upon receiving a data stream.

3. (Currently Amended) The system claimed in claim 1, further including comprising:

memory means adapted configured to store a table of correspondences between said application[[s]] and said service data, and wherein said first processor is configured processing means are adapted, on receiving a message designating an application, to access said memory means to determine service data stored in correspondence with said designated application, upon receiving a message designating an application.

4. (Currently Amended) The system claimed in claim 3, wherein

said <u>first processor is configured</u> processing means are adapted, in the absence in said memory means of service data stored in correspondence with a designated application, to send a user via a graphical interface of the communication terminal in which said extraction means are installed a message requesting said service data associated with the designated application, if service data corresponding to the designated application is not stored in said memory.

- 5. (Currently Amended) The system claimed in claim 3, wherein said <u>second processor is configured extraction</u>—means are adapted to update said correspondence table as a <u>function of based</u> on information received <u>from the communication terminal</u>.
- 6. (Currently Amended) The system claimed in claim 5, wherein said updating information received is contained in a configuration file received by the communication terminal in which said extraction means are installed.
- 7. (Currently Amended) The system claimed in claim 5, wherein said updating information received is delivered by a graphical interface of the communication terminal in which said extraction means are installed.
- 8. (Currently Amended) The system claimed in claim 1, wherein said <u>second processor is</u> extraction means are installed in a protocol stack of a communication terminal core.
- 9. (Currently Amended) The system claimed in claim 1, wherein each said communication station has at least one protocol stack arranged in layers, including a[[n]] MAC layer, and said controller is configured control means are adapted, on receiving service data, to deliver configuration data for configuring said MAC layer as a function of the requirements associated with a stream to be transmitted or received, upon receiving service data.
- 10. (Currently Amended) The system claimed in claim 1, wherein said <u>first processor is configured processing means are adapted</u> to deliver to said <u>controller control means</u> service data representative of at least one process associated with streams to be received

Page 4

from an application installed in a remote communication terminal.

11. (Currently Amended) The system claimed in claim 1, wherein said controller is

configured control means are adapted to deliver said configuration data on receiving an

authorization delivered by a central server of said network.

12. (Currently Amended) The system claimed in claim 1, wherein said first processor

processing means and said controller are configured control means are adapted to

exchange service messages containing said service data in accordance with an exchange

protocol chosen from among at least one of a proprietary protocol, the SNMP, the XML

protocol, and the RSVP.

13. (Currently Amended) The system claimed in claim 1, wherein said process is chosen

from a group including at least one of quality of service, encryption, authentication,

session set-up, stream prioritization, and stream elimination.

14. (Currently Amended) A communication terminal including said first processor

extraction means and said second processor processing means of a control system as

claimed in claim 1.

15. (Previously Presented) A communication terminal including a control system as

claimed in claim 1.

16. (Currently Amended) A communication station including said controller control

means of a control system as claimed in claim 1.

Application No. 10/716,465 Attorney Docket No. 29250P-000031/US

17. (Original) The communication station claimed in claim 16, taking the form of a

satellite terminal.

18. (Currently Amended) A communication network including a multiplicity plurality of

communication stations including said controller a control means of a control system as

claimed in claim 1 and communication terminals including said first processor

extraction means and said second processor processing means of said control system.

19. (Original) The communication network claimed in claim 18, chosen in a group

including at least satellite networks and wireless networks.
